Abstract

An extendable stylus operated with a mouth, the stylus having an extending portion configured to have an adjustable length, a conductive tip that can interface with a touch screen device, the conductive tip located at a first end of the extending portion, a mouthpiece that engages the mouth of a user, wherein the mouthpiece is located at a second end of the extending portion opposite the first end and a control mechanism disposed at or near the second end of the extending portion, wherein the control mechanism is configured to control the length of the extending portion based on an operation by the mouth of the user.
