Medical Care Highlights VA’s Community-Based Outpatient Clinics

The July issue of Medical Care features five HSR&D studies of VA’s fast growing Community-Based Outpatient Clinics (CBOCs). A team of HSR&D investigators was charged with evaluating key aspects of the CBOCs and then comparing the services CBOCs provide with the same services provided at VA medical centers. The researchers focused on: access to care, quality of care, utilization, patient satisfaction, and cost. Findings show that: patients in CBOCs perceive fewer problems with access and timeliness of care (eg, shorter waiting times) than do traditional VA clinic patients; CBOCs provide a similar level of quality of care as VAMCs in regard to prevention and disease detection; and total costs of care for veteran patients at CBOCs are lower compared to costs of care for patients treated in VAMCs. There were some areas in which CBOCs did not appear to perform as well as VAMCs. For example, CBOC patients had more visits with their primary care provider, but few specialty visits. This may warrant further investigation.

This research was supported by HSR&D, study #MRR 98-015.
